## **Author Correction:** Extracting Intercellular Signaling Network of Cancer Tissues using Ligand-Receptor Expression Patterns from Whole-tumor and Single-cell Transcriptomes

Joseph X. Zhou<sup>1</sup>, Roberto Taramelli<sup>2</sup>, Edoardo Pedrini<sup>2</sup>, Theo Knijnenburg<sup>1</sup> & Sui Huang<sup>1</sup>

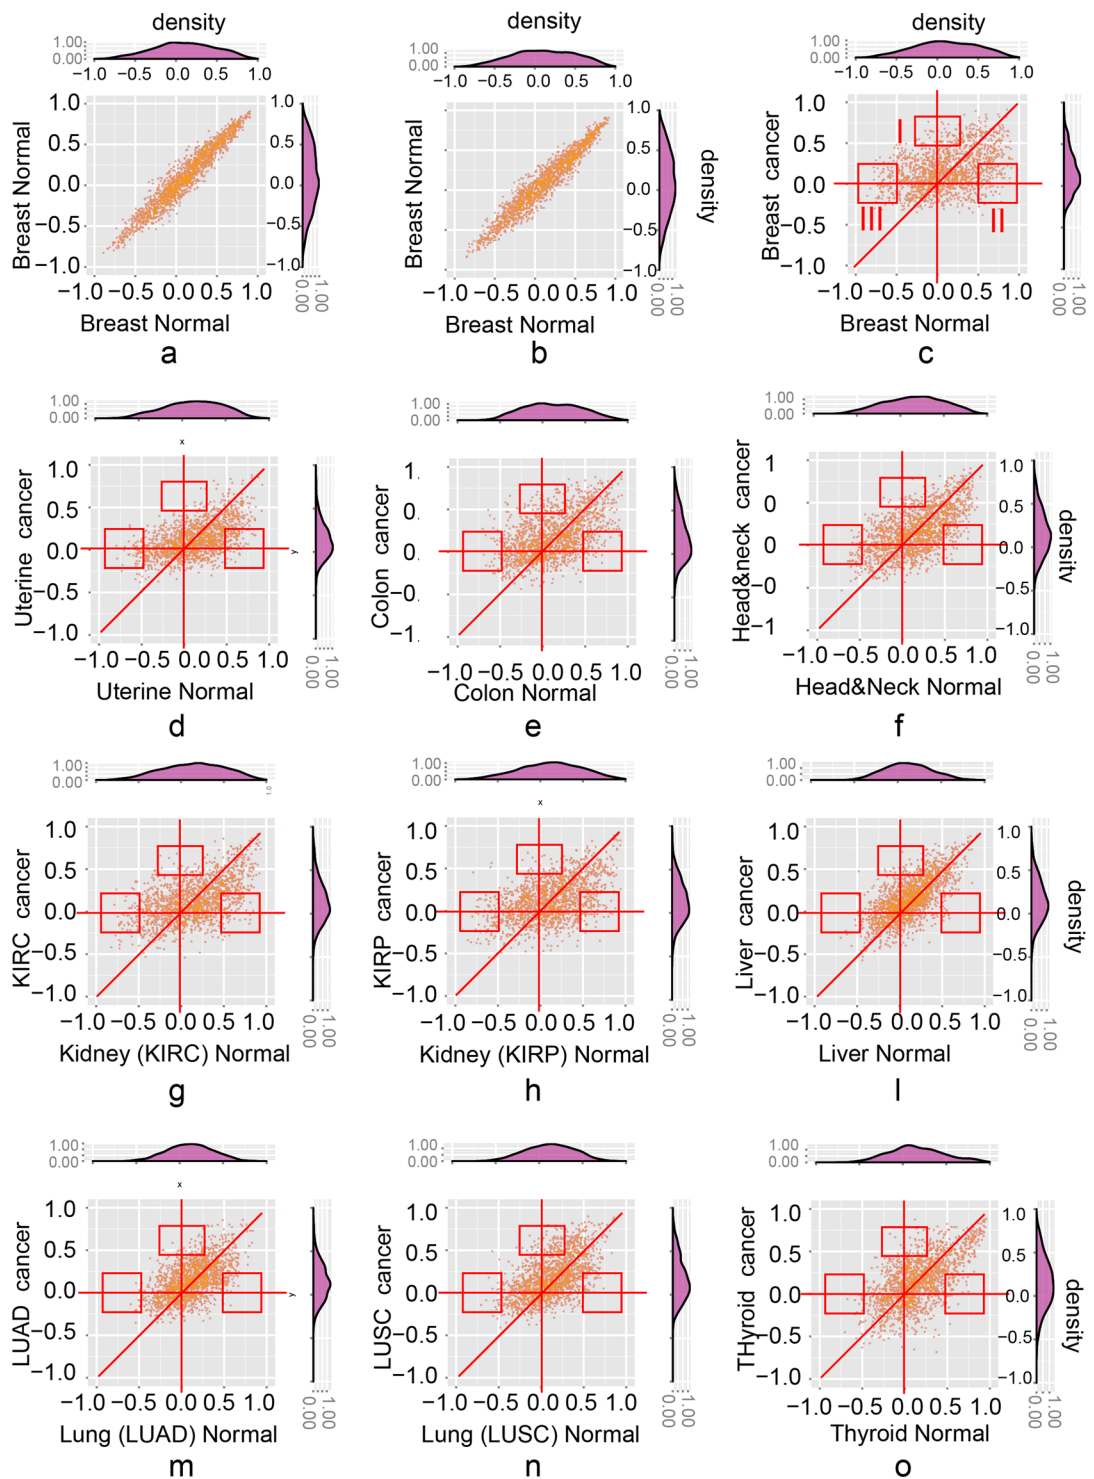

Correction to: *Scientific Reports* <https://doi.org/10.1038/s41598-017-09307-w>, published online 18 August 2017

This Article contains an error in the order of the Figures. Figures 5 and 6 were published as Figures 6 and 5 respectively. The correct Figures 5 and 6 appear below as Figures 1 and 2. The Figure legends are correct.

<sup>1</sup>Institute for Systems Biology, Seattle, WA, USA. <sup>2</sup>Department of Biotechnology and Molecular Science, University of Insubria, Varese, Italy. Joseph X. Zhou and Roberto Taramelli contributed equally. Correspondence and requests for materials should be addressed to S.H. (email: [sui.huang@systemsbiology.org](mailto:sui.huang@systemsbiology.org))

**Figure 1.** Spearman correlations in cancer and normal tissues are significantly different from randomly chosen pairs. **(a)** The Spearman correlation coefficients distribution (random (in red color) vs. defined (in blue) ligand-receptor gene pair) in cancer tissues. **(b)** The Spearman correlation coefficients distribution (random vs. defined ligand-receptor gene pair) in normal tissues.

**Figure 2.** The scatter plots show the altered ligand-receptor correlations between normal and cancer tissues of 10 cancer types. (a,b) The background noise of correlations in the normal breast tissue. The scatter plots of 2,558 ligand-receptor pairs from 65 samples which are randomly chosen 1,000 times from breast tissue (performed twice); (c–o) The scatter plots of ligand-receptor correlations (normal vs. cancer) of ten cancer types. Three types of altered correlations: (i) area *I*: changing from uncorrelated (Spearman correlation coefficients between  $-0.25$  and  $0.25$ ) to correlated (higher than  $0.5$ ); (ii) area *II*: changing from positively correlated (lower than  $-0.5$ ) to uncorrelated (between  $-0.25$  and  $0.25$ ); (iii) area *III*: changing from negatively correlated (higher than  $0.5$ ) to uncorrelated (between  $-0.25$  and  $0.25$ ).
